Triangle Relationships

Relationships in a 30-60-90 degree triangle

Let the **shortest leg** of the triangle (the side opposite the 30° angle) equal **t**
 Then the length of the **hypotenuse** is twice the length of the shortest leg: **2t**
 The length of the **longest leg** (the side opposite the 60° angle) is square root 3 times the shortest leg: **t√3**

Proof that longest leg = $t\sqrt{3}$ and hypotenuse = $2t$ given that shortest leg = t

Let $a = t$

$$a^2 + b^2 = c^2 = (2a)^2$$

$$a^2 + b^2 = 4a^2$$

$$b^2 = 3a^2$$

$$b = a\sqrt{3}$$

$$b = t\sqrt{3}$$

$$a^2 + b^2 = c^2$$

$$t^2 + (t\sqrt{3})^2 = c^2$$

$$t^2 + 3t^2 = c^2$$

$$c^2 = 4t^2$$

$$c = \sqrt{4t^2} = 2t$$

Relationships in a 45-45-90 degree triangle

The legs of a 45-45-90 degree triangle are equal
 Therefore, if one **leg** is named “**t**”, then the other **leg** will be “**t**” as well
 The **hypotenuse** is square root 2 times the length of a **leg**: **t√2**

Proof that hypotenuse = $t\sqrt{2}$:

According to the Pythagorean theorem,

$$2t^2 = t^2 + t^2$$

$$t\sqrt{2} = \sqrt{t^2} + \sqrt{t^2}$$

$$t = \frac{t\sqrt{2}}{\sqrt{2}}$$

$$t = t$$

Corollary: each diagonal (d) of a square is square root 2 times the length of a side (s)
